## 1.3 Feature

### New platform, new outlook

#### Spiral air outlet grille

Better outlook and lower noise

#### Built-in charge valve

Safer and easier maintenance

#### Round corner

Better outlook & safer

### High energy efficiency

#### 1 DC inverter compressor

Haier takes DC INV. compressor, 5% power input lower. (14kw)

#### 2 DC fan motor and 550mm big fan

38% power input lower and 8% airflow higher

#### 3 Larger heat exchanger

Heat exchange area rise 10%. (14kw)

#### 4 Charge Valve

Built-in charge valve enables safer and easier maintenance

#### 5 Low standby power

New PCB program, reduce 20% standby power consumption

### Comfort

#### 6 New aerodynamics fan

550mm super big diameter aerospace helix fan. Lowering sound level 3 dB(A)

#### 7 Enlarged air inlet path and spiral air outlet path

Air flow direction follows the grill direction. Lowering sound level 2-4 dB(A)

#### 8 Automatic sound-lowering program

Night mode set by PCB, 8dB(A) lower

### Convenience

#### 9 Double side "4" handles

Easy to carry

#### 10 "888" test panel

All running data & error code can be checked from "888" screen, which is easy for installers

#### 11 "Four-way" pipe connection

4-way (front, back, left & right) pipe connection, easy to design and install

## 2. Specification

|  | Max.Diff. indoor/ outdoor unit       | m                 | "50<br>40"                        |
|  | Max.Diff. indoor/ indoor unit        | m                 | 15                                |
| Connectable indoor unit ratio              |                                      | %                 | 50%~130%                          |
| Maximum indoor units                       |                                      | Piece             | 13                                |
| Connection wiring                          | Power wiring                         | mm <sup>2</sup>   | 4                                 |
|  | Signal wiring                        | mm <sup>2</sup>   | Shield wire : (0.75-2) *2         |
| Operation Range                            |                                      | °C                | Cooling: -5~50<br>Heating: -20~27 |

Normal condition: indoor temperature (cooling): 27°C DB/19°C WB, indoor temperature (heating): 20°C DB/14.5°C WB.

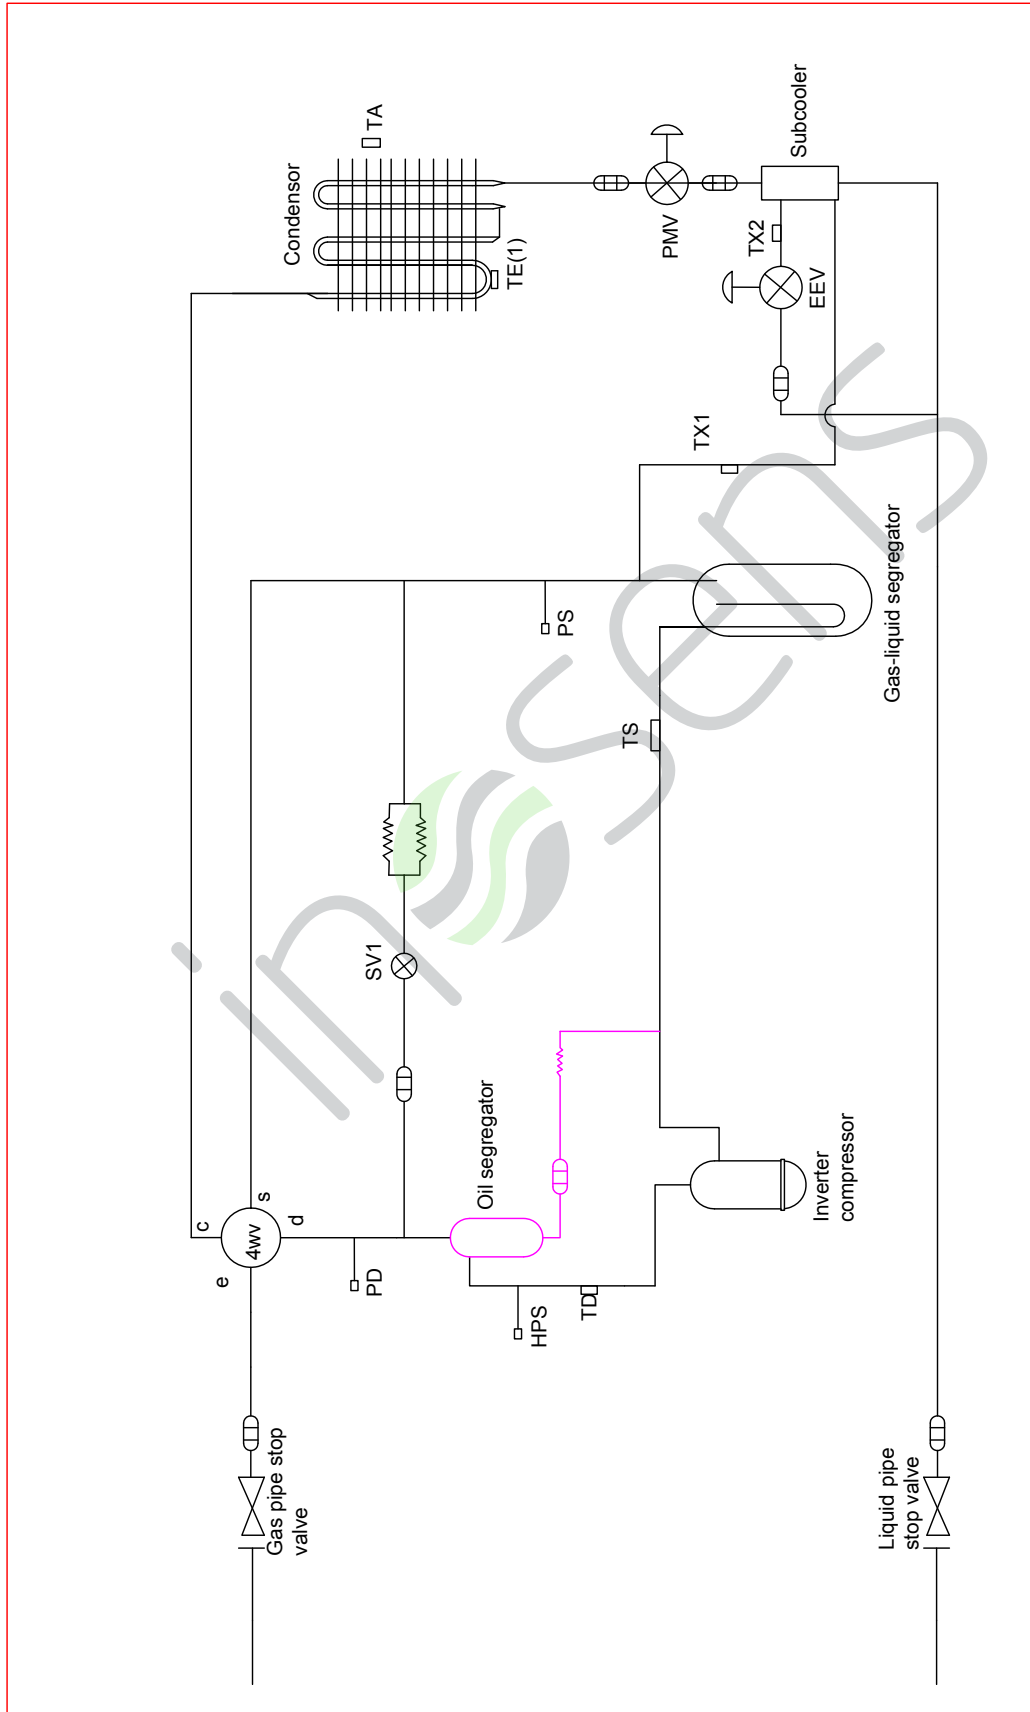

Outdoor temperature(cooling): 35°C DB/24°C WB, outdoor temperature(heating): 7°C DB/6°C WB The data is measured with 7.5m equivalent pipe and 0 m height difference.

The noise level will be measured in the third octave band limited values in the semi-anechoic chamber, using a Real Time Analyser calibrated sound intensity meter. It is a sound pressure noise level.

## 3. Dimension

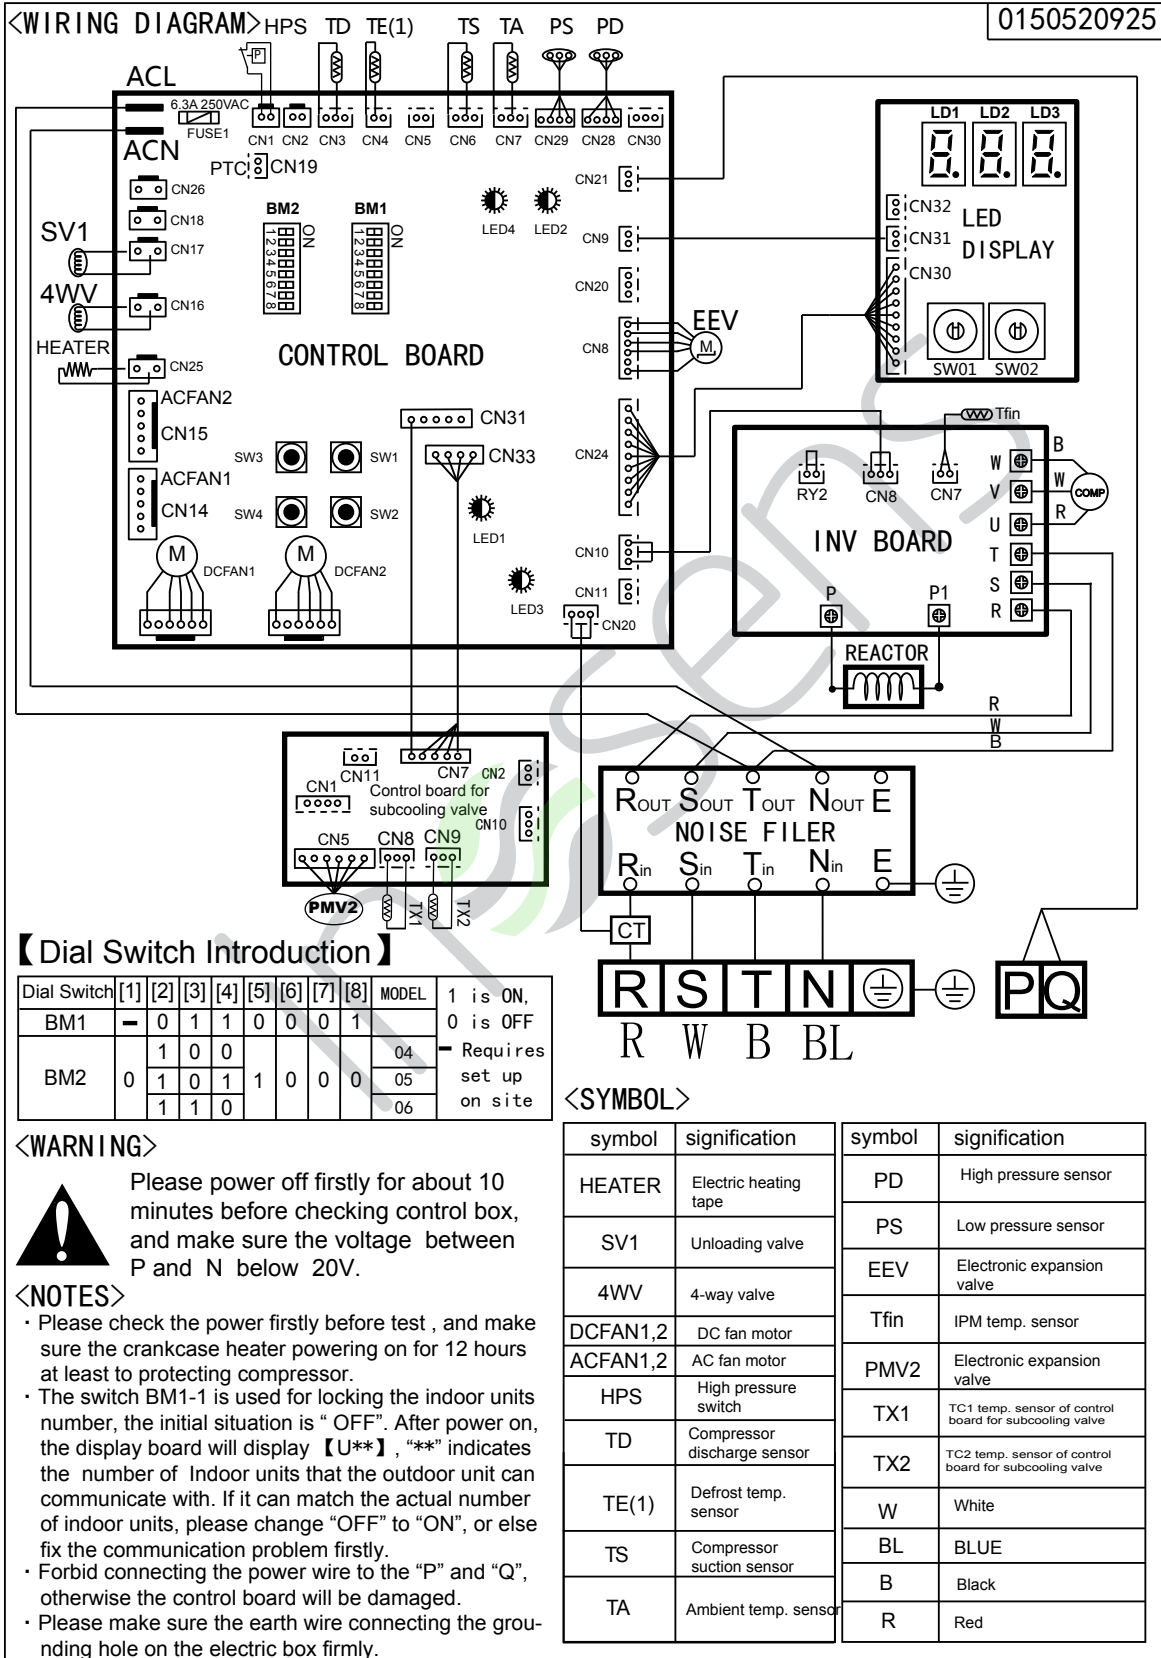

## 4. Piping Diagram

| Part name                  | Sign   | Function   | Date   | Note |
|----------------------------|--|--|--|------|
| Compressor                 | /  | Capacity control, meet indoor load request by adjusting frequency and opening and closing fixing frequency compressor. |  | 20°C |
| Pressure switch            | HPS  | High pressure protection   | 4.15Mpa, OFF   |      |
| Electronic expansion valve | EEV  | In heating, refrigerant flow control (subcooling valve)  | Φ3.0   |      |
| Solenoid valve             | SV1  | 1. Keep balance of high/low pressure when compressor starts up and stops<br>2. High/low pressure protection            | AC220V<br>Open when power is on, close when power is off.            | 2A   |
| 4-way valve                | 4WV  | Changing over between cooling and heating  | AC220V electrified in heating; powered off in cooling or defrosting. |      |
| Pressure sensor            | PD   | In heating, compressor frequency adjustment, abnormal pressure protection  |  |      |
|                            | PS   | In cooling, compressor frequency adjustment, abnormal pressure protection  |  |      |
| Temp. sensor               | TD   | Detect the top temp. of compressor   | R(80°C)=50K<br>B(25/80°C)=4450K                                      |      |
|                            | TS   | Detect the top suction of compressor   |  |      |
|                            | TA   | Detect ambient temp., set primary fan speed and control defrost condition  |  |      |
|                            | TX1  | Detect the temp. of before and after the supercooling valve to control the supercooling valve open angle.              | R(80°C)=10K<br>B(25/80°C)=3700K                                      |      |
|                            | TX2  |  |  |      |
| TE(1)                      | Detect frost condition of outdoor heat exchanger |  |  |      |
| Heater                     | Chi  | Used to heat oil in inverter compressor  | 28W, 220V, one   |      |

## 5. Wiring Diagram

## 6. Capacity Calculation Due to Capacity Modification Coefficient

(1) Calculation method of refrigerating capacity----cooling capacity to be known=refrigerating capacity\*(A\*B\*C\*D\*E)W

### A. Capacity compensation value of indoor air wet-bulb temperature condition

### B. Capacity compensation value of outdoor air dry-bulb temperature condition

### C. Capacity modification value under airflow variation rate of indoor unit group (only for duct unit)

### D. Capacity compensation suitable for total capability of indoor unit group

### E. Capacity compensation value of pipe length, pipe diameter and height drop

Notes for E:

(1) The main pipe (from outdoor to the first branch pipe) diameter should be enlarged one size when the single way pipe length is over 90m.

(2) When in cooling mode, outdoor is lower than indoor; or when in heating mode, outdoor is higher than indoor, the compensation factor should be decreased the below value from figure E.

| Vertical height drop between indoor and outdoor | 5m    | 10m   | 15m   | 20m   | 25m   | 30m   | 35m   | 40m   | 45m   | 50m  |
|---|-------|-------|-------|-------|-------|-------|-------|-------|-------|------|
| Adjustment factor                               | 0.003 | 0.006 | 0.009 | 0.012 | 0.015 | 0.018 | 0.021 | 0.024 | 0.027 | 0.03 |

## (2) Calculation method of refrigerating capacity----heating capacity to be known=refrigerating capacity\*(A\*B\*C\*D\*E\*F)W

### A. Capacity compensation value of indoor air dry-bulb temperature condition

### B. Capacity compensation value of outdoor air wet-bulb temperature condition

### C. Capacity modification value under airflow variation rate of indoor unit group (only for duct unit)

### D. Capacity compensation suitable for total capability of indoor unit group

### E. Capacity compensation value of pipe length, pipe diameter and height drop

### F. Capacity compensation value for defrost capability of outdoor heat exchanger

Notes for E:

- (1) The main pipe (from outdoor to the first branch pipe) diameter should be enlarged one size when the single way pipe length is over 90m.
- (2) When in cooling mode, outdoor is lower than indoor; or when in heating mode, outdoor is higher than indoor, the compensation factor should be decreased the below value from figure E.

| Vertical height drop between indoor and outdoor | 5m    | 10m   | 15m   | 20m   | 25m   | 30m   | 35m   | 40m   | 45m   | 50m  |
|---|-------|-------|-------|-------|-------|-------|-------|-------|-------|------|
| Adjustment factor                               | 0.003 | 0.006 | 0.009 | 0.012 | 0.015 | 0.018 | 0.021 | 0.024 | 0.027 | 0.03 |

## 7. Operation range

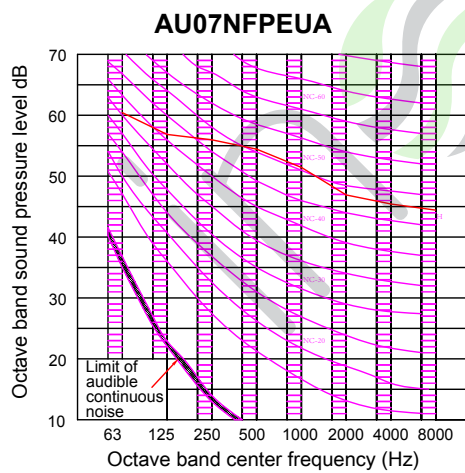

## 8. Sound Level

### (1) Testing illustration

### 2) Testing condition:

- Unit running in the nominal condition
- Test in the semi-anechoic chamber
- Noise level varies from the actual factors such as room structure, etc.

## 9. Outdoor Piping Installation

### 9.1 Product features

- The outdoor unit adopts "simultaneous control" type, all indoors should be heating or cooling simultaneously.
- To protect compressor, before startup, the unit should be electrified for 12 hours. If the unit is not used for a long time, please cut off the power to save energy, or the unit will consume the power.

This manual describes the installation and installation of outdoor units. For the installation of the indoor machine, please refer to the instruction manual of the indoor machine.

Please read the installation instructions carefully before installation, according to the instructions of the installation construction.

### 9.2 Safety

- If the air conditioner is transferred to the others, this manual should be transferred together.
- Before installation, please read "Safety precaution" carefully to confirm the correct installation.
- The mentioned precaution includes "⚠WARNING" and "⚠CAUTION". The precaution caused death or heavy injury for faulty installation will be listed in "⚠WARNING". Even the cautions listed in "⚠CAUTION" also may cause serious accident. So both of them are related to the safety, and should be executed severely.
- After installation, perform a trial and confirm everything normal, then introduce the operation manual to the user. Besides, put the manual to the user and ask them to preserve it carefully.

#### ⚠WARNING

- The installation or the maintenance should be performed by the authorized agency. Or the non-specialized operation will cause water leakage, electric shock or fire etc accidents.
- The installation should be executed as per the manual, or the faulty installation will cause water leakage, electric shock or fire etc accidents.
- Please install the unit at the space which can bear the weight. Or the unit will drop down to cause the human injury.
- The installation should defend against the typhoon, and the earthquake etc. Abnormal installation will cause the unit fall down.
- Use the correct cable and make reliable earthing. Fix the terminal firmly and the loose connection will cause heating or fire etc accident.
- The wiring should be in shape and can not be raised. Be earthed firmly and can not be clipped by the electric box cover or the other plate. The incorrect installation will cause heating or fire.
- When setting or transferring the unit, there should not be other air into the refrigerant system except for R410A. The gas mixture will cause the abnormal high pressure which will cause break or human injury etc accidents.
- When installation, please use the accessories with the unit or the special parts, or it will cause water leakage, electric shock, fire, refrigerant leakage etc accidents.
- Don't lead the water drainage pipe into the drainage groove with the poisonous gas, such as sulphur. Or the poisonous gas will enter indoor.
- In installation or after installation, please confirm if there is refrigerant leakage, please take measures for ventilation. The refrigerant will cause poisonous gas as meeting fire.
- Don't install the unit at the place where there may be flammable gas leakage. In case the gas leaks and gather around the unit, it will cause fire.
- The drainage pipe should be installed as per the manual to confirm the fluent drainage. Also take measures for heat insulation against dew drop. Incorrect water pipe installation will cause water leakage even and make the things wet.
- For the liquid pipe and the gas pipe, take measures for heat insulation too. If there is no heat insulation, the dew drop will wet the things.

#### ⊘ PROHIBIT

- This system using R410A refrigerant, prohibit filling oxygen, acetylene or other flammable and toxic gases in the air or test, because these gases are very dangerous and may cause explosion. It is recommended to use compressed air, nitrogen or refrigerant for such tests.
- Indoor or outdoor machines are not allowed to water. All of these products are equipped with electrical components, which may cause serious electric shock accidents.
- Do not touch or adjust the safety device in the indoor or outdoor machine. If touching or adjusting these devices can cause serious accidents.

- The maintenance cover plate of the indoor or outdoor machine is forbidden when the main circuit power supply is not cut off.
- The leakage of refrigerant can cause the air to be thin and difficult to breathe. In case of refrigerant leakage, close the main valve, extinguish any flame and contact the local distributor immediately.
- Please use ELB (leakage protector). If not used, an electric shock or fire may occur when an accident occurs.
- The installation and Service Engineer shall ensure that the refrigerant leaks comply with local laws and regulations.

## ⚠CAUTION

- Execute earthing for the unit. But the earthing wire can not be connected to the gas pipe, water pipe, lightning rod or the telephone earthing wire. Improper earthing will cause electric shock.
- Don't install the unit at the place where leaks the flammable gas. Or it will cause fire.
- Execute the water drainage pipe according to the manual, improper installation will cause water leakage to wet the family things.
- The outdoor fan can not face to the flower or the other vegetable, or the blowing gas will make the flower dried up.
- Please ensure the maintenance room, if not, it will cause the maintenance person damaged.
- When installing the unit on the roof or the other high place, to prevent the person falling down, please set the fixed ladder and the railing at the passage.
- Use the two-end spanner, and fasten the nut at proper torque. Don't fasten the nut excessively against the flared section broken. Or it will cause refrigerant leakage and lack of oxygen.
- Take measures for heat insulation to the refrigerant pipe, or there will be water leakage or dew drop to wet the family things.
- After finishing the refrigerant pipe, make leakage test by charging the nitrogen. In case the refrigerant leaks in a small room and exceeds the limited concentration, it will cause lack of oxygen.
- Don't use the other refrigerant except for R410A. The R410A pressure is 1.6 times higher than R22 pressure. The refrigerant R410A tank is marked with pink sign.
- Against charging different refrigerant, we changed the stop valve diameter of the R410A unit. To enhance the compression consistence, we also changed the flared pipe dimension. Prepare the R410A specially tools according to the below table.

|   | R-410A specified tools                            | Remarks   |
|---|---|---|
| 1 | Gauge manifold                                    | Range: HP > 4.5MPa, LP > 2MPa                           |
| 2 | Charge hose                                       | Pressure: HP: 5.3MPa, LP: 3.5MPa                        |
| 3 | Electronic balance for charging R410A             | Can not use the measurable charging tank                |
| 4 | Torque spanner                                    |   |
| 5 | Flare tool  |   |
| 6 | Copper pipe gauge for adjusting projecting margin |   |
| 7 | Vacuum pump adapter                               | Must be with reverse stop valve                         |
| 8 | Leakage detector                                  | Can not use freon leakage detector, but the He detector |

- When charging refrigerant, the refrigerant must be taken out as liquid state from the tank.
- When installing the power cord and the connecting line must be at least 1m from the TV or radio, so as to avoid image interference or noise.
- In the room with fluorescent lamp (reverse or fast start type), remote control signal transmission distance may not reach the predetermined value, so the indoor machine installed away from the fluorescent lamp as far as possible.
- Please use the fuse to meet the capacity requirements.
- To prevent the destruction of wires, electrical components, etc. by rats or other animals.
- Recommended room ventilation every 3 to 4 hours.

## Arrival inspection

- After receiving the machine, should check whether there is transport damage. If any damage is found on the surface or inside, it shall be reported immediately to the shipping company in writing.
- Check the product model, electrical parameters (power supply, voltage, frequency) and accessories to determine whether they meet the requirements.

## 9.3 Transportation and lifting

### Lifting

In front of the unit shipped from unpacking location as close as possible.

#### ⚠ CAUTION

- Do not place anything on the device.
- Two ropes shall be used for lifting the outdoor unit.

### Hoisting method

Hoisting to ensure that the level of outdoor machine, slowly lifting.

1. Removal of outer packing is strictly prohibited
2. As shown by two ropes hoist with outdoor machine packaging.

#### ⚠ CAUTION

- In order to ensure safety, maintain the level of lifting, slowly lifting.
- Do not lift the elevator to the packing and outer packing of the equipment.
- External protection should be used when lifting, such as cloth or cardboard.

### Manual handling

#### ⚠ CAUTION

- In the installation and commissioning, the outdoor machine do not put any irrelevant material, to ensure that there is no debris inside the machine, or there may be a fire or accident.

### Pay attention to the following points when handling the equipment manually:

1. No demolition wood base.
2. In order to prevent the dumping of the outdoor machine, the center of gravity of the unit should be noted as shown in the figure.
3. Two or more people to carry out the outdoor machine.

## 9.4 Installation instruction

In installation, please check specially the below items:

- If the connected units quantity and the total capacity is in the allowable range?
- If the refrigerant pipe length is in the limited range?
- If the pipe size is proper? And if the pipe is installed horizontally?
- If the branch pipe is installed horizontally or vertically?
- If the additional refrigerant is counted correctly and weighed by the standard balance?
- If there is refrigerant leakage?
- If all the indoor power supplies can be on/off simultaneously?
- If the power voltage is in compliance with the data marked on the rating label?
- If the address of indoors has been set?

### (1) Before installation

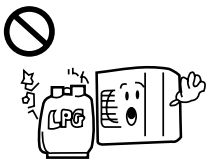

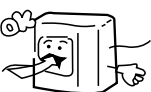

- 1) Before installation, check if the model, power supply, pipe, wires and parts purchased respectively are correct.
- 2) Check if the indoors and outdoors can be combined as the following.

| Outdoor |                 |                  | Indoor     |                              | Indoor capacity (100W) | Total indoor capacity (100W) | Branch pipe (optional) |
|---------|-----------------|------------------|------------|------------------------------|------------------------|------------------------------|------------------------|
| HP      | Capacity (100w) | Combination type | Indoor qty | Total indoor capacity (100W) |                        |                              |                        |
| 7       | 180             | Single           | 13         | 90-234                       | 22                     | less than 335                | FQG-B335A              |
|         |                 |                  |            |                              | 28                     |                              |                        |
|         |                 |                  |            |                              | 36                     |                              |                        |
|         |                 |                  |            |                              | 40                     |                              |                        |
|         |                 |                  |            |                              | 45                     |                              |                        |
|         |                 |                  |            |                              | 56                     |                              |                        |
|         |                 |                  |            |                              | 71                     |                              |                        |

Notice:

- Total capacities of indoor units being used  $\leq 100\%$  of rated capacities of outdoor unit.
- The maximum number of connections in accordance with the indoor units 2200W. At the same time in order not to affect the use of results, the maximum number of indoor machine connection recommended in accordance with 6/8/9.

### (2) Installation place selection

|   |   |  |
|---|---|--|
| <p>Air-conditioner can't be installed in the place with inflammable gas. Or it will cause fire hazard.</p>           | <p>The unit should be installed at the place with good ventilation. No obstacle at the air inlet/outlet. And no strong wind blows the unit.</p>  <p>The installation space refers to the latter info.</p>  | <p>The unit should be installed at the strong enough place. Or it will cause vibration and noise.</p>   |
| <p>The unit should be installed at the place where the cold/hot air or noise will not interfere the neighbours.</p>  | <ul style="list-style-type: none"> <li>• The place where the water can flow fluently.</li> <li>• The place where no other heat source will affect the unit.</li> <li>• Pay attention to the snow against clogging the outdoor.</li> <li>• In installation, install the anti-vibration rubber between the unit and the bracket.</li> </ul> | <ul style="list-style-type: none"> <li>• The unit is better not be installed at the below places, or it will cause damage.</li> <li>• The place where there is corrosive gas (spa area etc).</li> <li>• The place blowing salty air (seaside etc).</li> <li>• Exsists the strong coal smoke.</li> <li>• The place with high humidity.</li> <li>• The place where there is device emitting Hertzian waves.</li> <li>• The place where voltage changes greatly.</li> </ul> |

**Note:**

1. In snowy area, install the unit under the bracket or the snow-proof cover against the accumulative snow on the unit.
2. Do not install the unit at the place where the flammable gas will leak.
3. Install the unit at the strong enough place.
4. Install the unit at the flat place.
5. When being installed at the place with strong wind, set the air outlet of the unit and the wind direction vertical.
6. The installation site should be far away from the place where the noise is higher. At the same time for the noise of higher places should ensure that the outdoor machine vibration and wall insulation measures to prevent vibration caused by thin wall or acoustic noise problems.
7. Aluminum foil fin is very sharp, pay attention to prevent scratches.
8. In addition to the maintenance of the roof, or the installation of outdoor machines, other people can not contact the outdoor machine.

### (3) Installation and maintenance space

#### Selection of installation location of outdoor

(1) Single-unit installation (unit: in.(mm))

The top and two side surfaces must be exposed to open space, and barriers on at least one side of the front and back shall be lower than the outdoor unit.

(2) Multi-unit installation (unit: in.(mm))

Height of barriers is below that of outdoor unit

### (3) Multi-unit installation in front and back (unit: in.(mm))

Standard

The top and two side surfaces must be exposed to open space, and barriers on at least one side of the front and back shall be lower than the outdoor unit.

- The installation service spaces shown in the illustrations are based on an air intake temperature of 95°F(35°C)(DB) for COOL operation. In regions where the air intake temperature regularly exceeds 95°F(35°C)(DB), or if the heat load of outdoor units is expected to regularly exceed the maximum operating capacity, reserve a larger space than that indicated at the air intake side of units.
- Regarding the required air outlet space, position the units with consideration to the space required for the onsite refrigerant piping work as well. Consult your dealer if the work conditions do not match those in the drawings.

### (4) Precautions on installation

#### NOTICE

If drain holes of the outdoor unit are covered by a mounting base or by floor surface, raise the unit in order to provide a free space of more than 5in.(130mm) under the outdoor unit.

#### Foundation work

- Check the strength and level of the installation ground so that the unit will not cause any operating vibration or noise after installation.
- In accordance with the foundation drawing in the figure, fix the unit securely by means of the foundation bolts.
- It is best to screw in the foundation bolts until their length are 0.8in.(20mm) from the foundation surface.

- Fix the outdoor unit to the foundation bolts using nuts with resin washers(1) as shown in the figure.
- If there is no need to install the outdoor machine in the open space of the building or the enclosure, the following two ways can be used to avoid the fan reversal or damage caused by strong wind blowing.

#### (1) Using the windshield

#### (2) Near wall installation

If the coating on the fastening area is stripped off, the nuts rust easily.  
Dimensions (bottom view) (unit of measurement: mm)

## (5) Refrigerant pipe connection

### Pipe connection method:

- To ensure the efficiency, the pipe should be as short as possible.
- Daub the refrigerant oil on the connector and the flare nut.
- When bending the pipe, the bending semi-diameter should be as large as possible against the pipe being broken or bent.
- When connecting the pipe, aim at the center to thread the nut by hand and tighten it with the double spanners.
- Don't let the impurity such as sand, water etc into the pipe.

When fastening and loosening the nut, operate with double spanners, because only one spanner cannot execute firmly.

If threading the nut as not aiming at the center, the screw thread will be damaged, further it will cause leakage.

### Cautions in piping installation:

- When welding the connector with hard solder, charge nitrogen into the pipe against oxidation. Or the oxygen film in the pipe will clog the capillary and the expansion valve, even cause the deathly accident.
- The refrigerant pipe should be clean. If the water and the other impurity enter the pipe, charge the nitrogen to clean the pipe. The nitrogen should flow under the pressure of about 0.5Mpa and when charging the nitrogen, stop up the end of the pipe by hand to enhance the pressure in the pipe, then loose the hand (meanwhile stop up the other end).
- The piping installation should be executed after the stop valves are closed.
- Before welding the valve and the pipes, use the wet cloth to cool down the valve and the pipes.
- When the connection pipe and the branch pipe need to be cut down, please use the special shears and cannot use the saw.

### Pipe material and specs selection

1. Please select the refrigerant pipe of the below material.  
Material: the phosphoric oxidize seamless copper pipe, model: C1220T-1/2H (diameter is over 19.05); C1220T-0 (diameter is below 15.88).
2. Thickness and specs:  
Confirm the pipe thickness and specs according to the pipe selection method (the unit is with R410A, if the pipe over 19.05 is 0-type, the pressure preservation will be bad, thus it must be 1/2H type and over the min. thickness).
3. The branch pipe must be from Haier.
4. When installing the stop valve, refer to the relative operation instruction.
5. The pipe installation should be in the allowable range.
6. The installation of branch pipe and gather pipe should be performed according to the relative manual.

### Drain pipe disposal

- Make sure the drain works properly.
- In regions where buildups of snow can be expected, the accumulation and freezing of snow in the space between the heat exchanger and external plate may lower operating efficiency.
- After punching the knock-out hole, the application of repair-type paint on the surface around the edge sections is recommended to prevent rust.

### Pipe specification:

1. Pipe "a" diameter (between indoor and branch pipe) (depends on indoor pipe)  
Please refer to the indoor air conditioner manual.
2. Pipe "b" diameter (between branch pipes)

| Total indoor capacity after the branch pipe (x100W) | Gas pipe (mm) | Liquid pipe (mm) |
|---|---------------|------------------|
| X<112   | Ø15.88        | Ø9.52            |
| 112≤X< 234  | Ø19.05        | Ø9.52            |

3. Pipe "c" diameter ( outdoor pipe diameter)

| Outdoor capacity (100W) | Gas pipe (mm) | Liquid pipe (mm) |
|-------------------------|---------------|------------------|
| 180                     | Ø15.88        | Ø9.52            |

Copper pipe selection:

| hardness            | Softness |       |       |        |
|---------------------|----------|-------|-------|--------|
| Outer diameter (mm) | Ø6.35    | Ø9.52 | Ø12.7 | Ø15.88 |
| Min. thickness (mm) | 0.8      | 0.8   | 1.0   | 1.0    |

| hardness            | Half-hardness |        |        |        |
|---------------------|---------------|--------|--------|--------|
| Outer diameter (mm) | Ø19.05        | Ø22.22 | Ø25.24 | Ø28.58 |
| Min. thickness (mm) | 1.0           | 1.1    | 1.2    | 1.4    |

Note: If the copper pipe with outer diameter 19.05 is coil pipe, the thickness should be over 1.1.

### Piping connection method:

Pipes can be connected in four directions

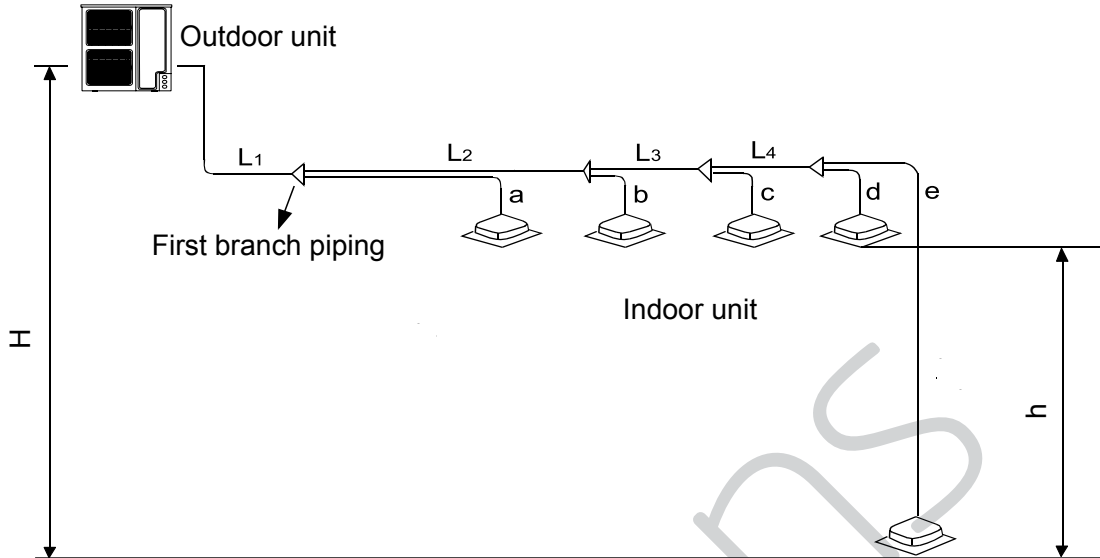

As shown in the figure, the piping can be connected from four directions. Through the front / rear hole piping piping on the cover hole or crack directly across the floor.

From the outdoor machine unloading piping cover with a screwdriver and hammer knock off holes along the guide wire break. Then, trim the edges of the holes, and mounted on the insulating sleeve (site) to protect the piping and wiring.

## Long pipe and high drop

### 1. Allowable pipe length and height difference

|                   |   | Permissible value    | Piping part           |   |
|-------------------|---|----------------------|-----------------------|---|
| Piping length     | Total length of piping (actual length)  | 300m                 | L1+L2+L3+L4+a+b+c+d+e |   |
|                   | Single way max. pipe length   | 150m/175m            | L1+L2+L3+L4+e         |   |
|                   | Pipe length between outdoor and first branch pipe                                   | 110m                 | L1                    |   |
|                   | Pipe length after first branch pipe (length between first branch & farthest indoor) | 40m                  | L2+L3+L4+e            |   |
|                   | Pipe length between the indoor unit & the nearest branch length                     | 10m                  | a / b / c / d / e     |   |
| Height difference | Height difference between indoor and outdoor unit                                   | Indoor below outdoor | 50m                   | H |
|                   |   | Indoor above outdoor | 40m                   | H |
|                   | Height difference between indoor units  | 15m                  | h                     |   |

Note:

When the single way pipe length is over 30m, the main pipe should be the enlarged diameter.

### Unit pipe spec and connection method (unit: mm)

#### A. Outdoor unit

| Model | Gas pipe side |                   | Liquid pipe side |                   |
|-------|---------------|-------------------|------------------|-------------------|
|       | Diameter (mm) | Connecting method | Diameter (mm)    | Connecting method |
| AU07  | Ø15.88        | Flared joint      | Ø9.52            | Flared joint      |

#### B. Indoor unit

Please refer to the indoor air conditioner manual.  
Connecting method: Flared joint

### Branch pipe

Outdoor unit type

Branch pipe selection:

| Total indoor capacity (100W) | Model (optional) |
|------------------------------|------------------|
| Less than 335                | FQG-B335A        |

#### C. Pipe spec and the torque

| Diameter (mm)        | Thickness (mm) | Torque (N.m) |
|----------------------|----------------|--------------|
| Ø6.35                | 0.8            | 16~20        |
| Ø9.52                | 0.8            | 40~50        |
| Ø12.7                | 1.0            |              |
| Ø15.88               | 1.0            | 90~120       |
| Ø19.05               | 1.0            | 100~140      |
| Ø22.22               | 1.1            | —            |
| Ø25.4                | 1.2            | —            |
| Not less than Ø28.58 | More than 1.4  | —            |

Note: If the copper pipe with outer diameter 19.05 is coil pipe, the thickness should be over 1.1.

Note:

1. When connecting the pipe and the outdoor, please pay attention to the outdoor pipe dimension.
2. When adjusting the diameter among pipes and among the units, please must execute at the branch pipe side.
3. When welding with hard solder, please must blow nitrogen. If not, a number of oxide will be produced and cause heavy damage. Besides, to prevent water and dust into the pipe, please make the brim as outer roll.

### Heat insulation

- Gas pipe and liquid pipe should be heat insulated separately.
- The material for gas pipe should endure the high temperature over 120°C. That for liquid pipe should be over 70°C.
- The material thickness should be over 10mm, when ambient temp. is 30°C, and the relative humidity is over 80%, the material thickness should be over 15mm.
- The material should cling the pipe closely without gap, then be wrapped with adhesive tape. The connection wire can not be put together with the heat insulation material and should be far at least 20cm.

### Fix the refrigerant pipe

- In operation, the pipe will vibrate and expand or shrink. If not being fixed, the refrigerant will focus on one part to cause the broken pipe.
- To prevent the central stress, fix the pipe for every 2-3m.

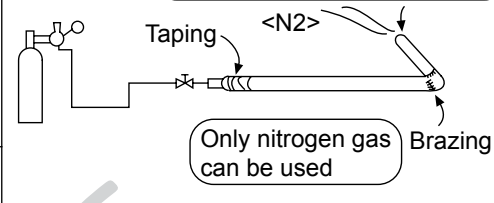

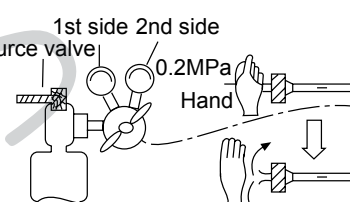

### Pipe installation

When doing the piping connection, please do the following:

- Please don't let the pipe and the parts in the unit collide each other.
- When connecting the pipes, close the valves fully.
- Protect the pipe end against and water, impurities (welding after being flatted, or being sealed with adhesive tape).
- Bend the pipe as large semi-diameter as possible (over 4 times of the pipe diameter).
- The connection between outdoor liquid pipe and the distributing pipe is flared type. Please expand the pipe with the special tool for R410A after installing the expanding nut. But if the projecting pipe length has been adjusted with the copper pipe gauge, you can use the original tool to expand the pipe.
- Since the unit is with R410A, the expanding oil is ester oil, not the mineral oil.
- When doing the flare connection, please do the following: When connecting the expanding pipe, fasten the pipes with double-spanner. The torque refers to the former info.

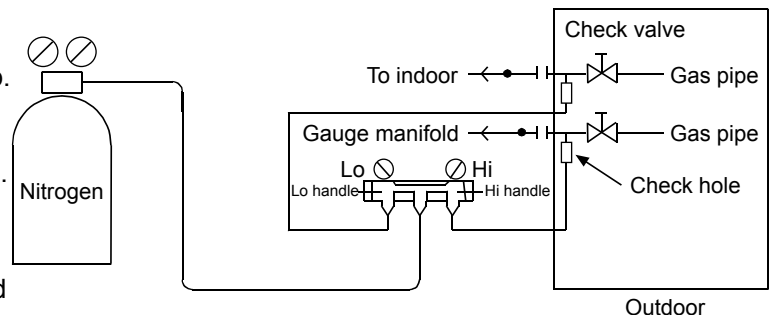

| Expanding pipe: A(mm)    |                                | Diagram | Projecting length of pipe to be expanded: B(mm) |  |                 |
|--------------------------|--------------------------------|---------|---|--|-----------------|
| Pipe outer diameter (mm) | A <sup>0</sup> <sub>-0.4</sub> |         | Pipe outer diameter (mm)                        | When it is hard pipe<br>Special tool for R410A | The former tool |
| Ø6.35                    | 9.1                            |         | Ø6.35   | 0-0.5  | 1.0-1.5         |
| Ø9.52                    | 13.2                           |         | Ø9.52   |  |                 |
| Ø12.7                    | 16.6                           |         | Ø12.7   |  |                 |
| Ø15.88                   | 19.7                           |         | Ø15.88  |  |                 |

- The outdoor gas pipe and the refrigerant distributing pipe, as well the refrigerant distributing pipe and the branch pipe should be welded with hard solder.

|   |  |
|---|--|
| <ul style="list-style-type: none"> <li>Weld the pipe at the same time charge the nitrogen. Or it will cause a number of impurity (a film of oxidation) to clog the capillary and the expansion valve, further cause the deadly failure.</li> </ul>  | <div style="border: 1px solid black; padding: 5px; margin-bottom: 5px;">Seal the pipe end with adhesive tape or the stopper to increase the resistance, fill up the pipe with nitrogen.</div>  |
| <ul style="list-style-type: none"> <li>Protect the pipe end against the water, impurity into the pipes (welding after being flat, or being sealed with adhesive tape).</li> </ul>    |  |
| <ul style="list-style-type: none"> <li>The refrigerant pipe should be clean. The nitrogen should flow under the pressure of about 0.2Mpa and when charging the nitrogen, stop up the end of the pipe by hand to enhance the pressure in the pipe, then loose the hand (meanwhile stop up the other end).</li> </ul> |   |
| <ul style="list-style-type: none"> <li>When connecting the pipes, close the valves fully.</li> </ul>  |  |
| <ul style="list-style-type: none"> <li>When welding the valve and the pipes, use the wet cloth to cool down the valve and the pipes.</li> </ul>   |  |

## (6) Leakage test

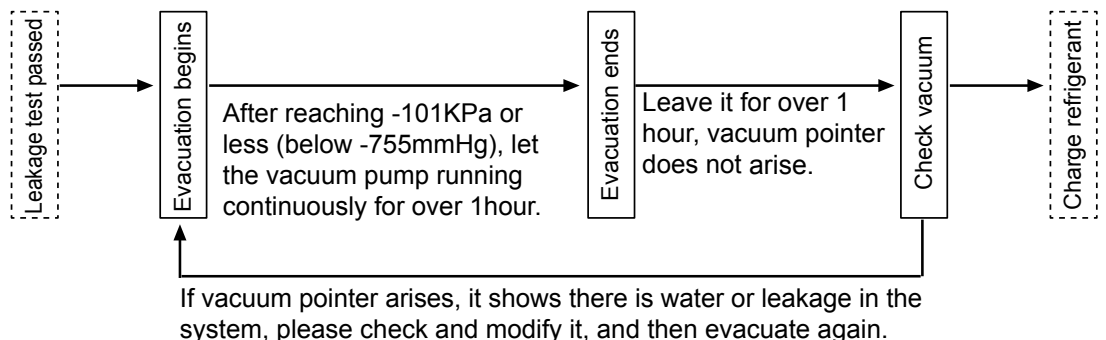

- The outdoor unit has been executed the leakage test in the factory. After connecting the distributing pipe, execute the leakage test from the outdoor check valve and the indoor. Besides, while testing, the valves should be close.
- Refer to the below figure to charge the nitrogen into the unit to take a test. Never use the chlorine, oxygen, flammable gas in the leakage test. Apply pressure both on the gas pipe and the liquid pipe.
- Apply the pressure step by step to the target pressure.
  - Apply the pressure to 0.5MPa for more than 5 minutes, confirm if pressure goes down.
  - Apply the pressure to 1.5MPa for more than 5 minutes, confirm if pressure goes down.
  - Apply the pressure to the target pressure (4.0MPa), record the temp. and the pressure.
  - Leave it at 4.0MPa for over 1 day, if pressure does not go down, the test is passed. Meanwhile, when the temp. changes for 1degree, pressure will change 0.01MPa as well. Correct the pressure.
  - After confirmation of a~d, if pressure goes down, there is leakage. Check the brazing position, flared position by laying on the soap. modify the leakage point and take another leakage test.
- After leakage test, must execute the evacuation.

## (7) Evacuation

Evacuate at the check valve of liquid stop valve and both sides of the gas stop valve.

Operation procedure:

Because the unit is with refrigerant R410A, the below issues should be paid attention:

- To prevent the different oil into the pipe, please use the special tool for R410A, especially for gauge manifold and charging hose.
- To prevent the compressor oil into the refrigerant cycle, please use the anti-counter-flow adapter.

## (8) Check valve operation

Open/close method:

- Take down the valve cap.
- Turn the liquid stop valve and the gas stop valve with hexangular spanner until it stops. If opening the valve strongly, the valve will be damaged.
- Tighten the valve cap.

Tighten torque as the table below:

| Tighten torque N.m |                    |                |                           |
|--------------------|--------------------|----------------|---------------------------|
|                    | Shaft (valve body) | Cap (cover)    | T-shape nut (check joint) |
| For gas pipe       | Less than 7        | Less than 30   | 13                        |
| For liquid pipe    | 7.85 (MAX15.7)     | 29.4 (MAX39.2) | 8.8 (MAX14.7)             |

## (9) Additional refrigerant charging

Charge the additional refrigerant as liquid state with the gauge.

If the additional refrigerant can not be charged totally when the outdoor stops, charge it at the trial mode.

If the unit runs for a long period in the state of lack of refrigerant, compressor will occur failure.

(the charging must be finished within 30 minutes especially when the unit is running, meanwhile charging the refrigerant).

A. Charging amount when out of factory excludes the refrigerant in the pipe.

B. The unit only is charged the standard volume of refrigerant (distributing pipe length is 0m). Additional charging amount=actual length of liquid pipe x additional amount per meter liquid pipe

Additional charging amount=L1×0.35+L2×0.25+L3×0.17+L4×0.11+L5×0.054+L6×0.022

L1: total length of 22.22 liquid pipe; L2: total length of 19.05 liquid pipe; L3: total length of 15.88 liquid pipe;

L4: total length of 12.7 liquid pipe; L5: total length of 9.52 liquid pipe; L6:total length of 6.35 liquid pipe;

C. Refrigerant charging and additional charging

| Additional refrigerant charging per meter(kg/m) |        |        |       |       |       | Charge when out of factory |
|---|--------|--------|-------|-------|-------|----------------------------|
| Ø22.22  | Ø19.05 | Ø15.88 | Ø12.7 | Ø9.52 | Ø6.35 |                            |
| 0.35  | 0.25   | 0.17   | 0.11  | 0.054 | 0.022 | Refer to label             |

Note:

- To prevent the different oil into the pipe, please use the special tool for R410A, especially for gauge manifold and charging hose.
- Mark the refrigerant type in different colour on the tank. R410A is pink.
- Must not use the charging cylinder, because the R410A will change when transferring to the cylinder.
- When charging refrigerant, the refrigerant should be taken out from the tank as liquid state.
- Mark the counted refrigerant volume due to the distributing pipe length on the label.

GWP: 2088

The product contains fluorinated greenhouse gases and its functioning relies upon such gases.

## (10) Refrigerant recovery

- Start: press the main control board of the Start and Stop keys at the same time for 5 seconds, the machine enters the refrigerant automatic recovery control: the compressor starts, the right side of the machine C0 and Ps digital tube flashing, lasted for about 3 minutes.
- Operation: when the digital tube C1 and Ps alternately flashing, manually shut off the liquid pipe valve, the refrigerant recovery.
- Off valve: when Ps < 1kg, digital tube display C2, fast manual shut-off valve, 5S after the system shut down.
- End: manual power down for program reset.

Note: heating, standby or shutdown: outdoor machine forced to refrigeration operation.

## 10. Outdoor Wiring Installation

### ⚠ WARNING

- Switch off the main power switch of the indoor and outdoor machine for more than 1 minutes before the wiring or regular inspection.
- To prevent the destruction of wires and electrical components by rats or other animals. Serious, it may lead to the occurrence of fire.
- To avoid damage to the wire, avoid contact with refrigerant pipes, steel edges and electrical components. Serious, it may lead to the occurrence of fire.

### ⚠ CAUTION

- Secure the power cord with a wire tie in the machine.

Note:  
when the wiring of the outdoor machine is not using the wire, it should be fixed with the rubber ring.

### ⚠ CAUTION

- In the case of 3 phase 5 wire type, the power supply of the indoor machine must be connected use L1 line and N line, prohibit the use of L1-L2, L1-L3, Otherwise the electrical part will be damaged.

### Inspect

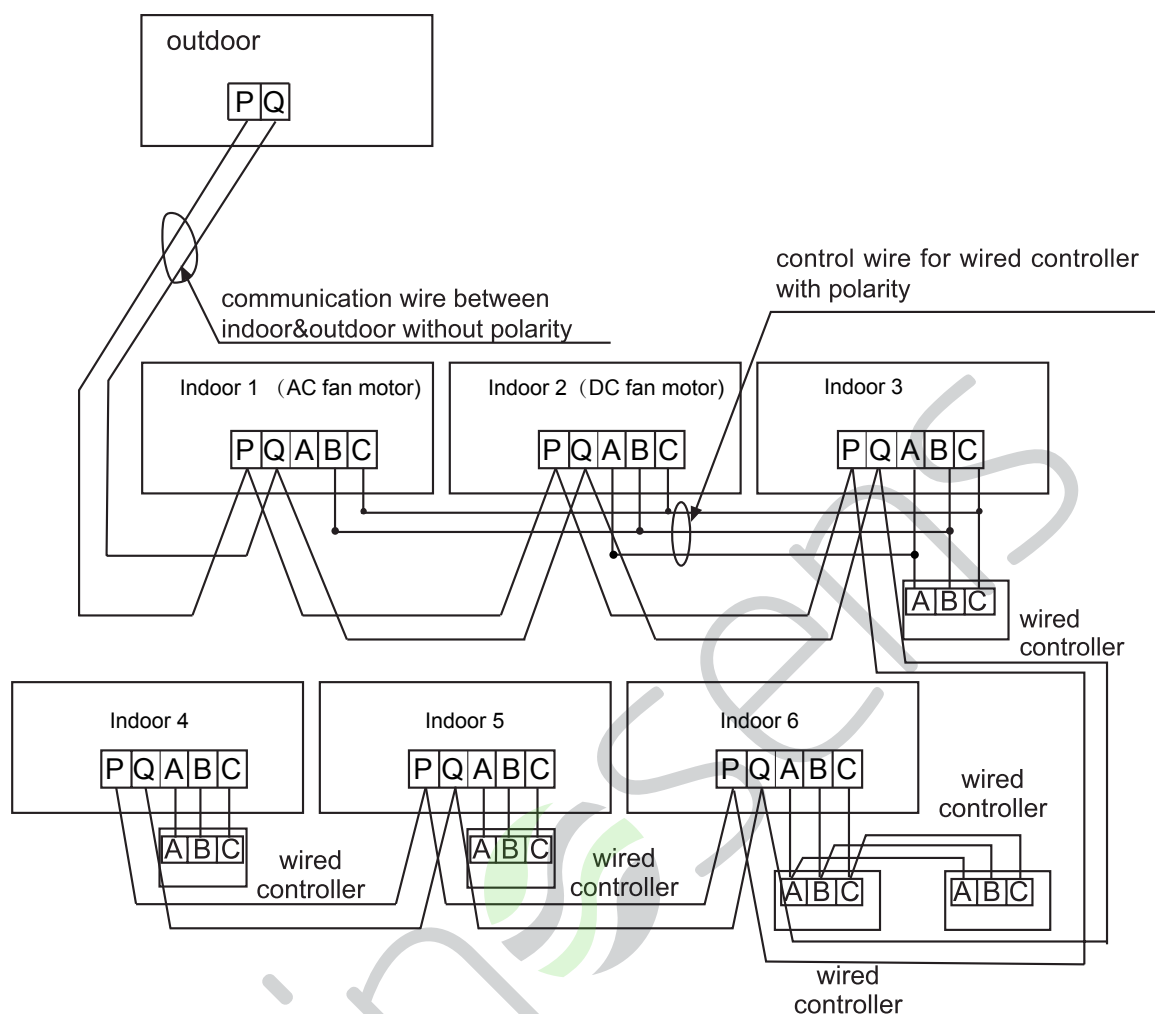

- To ensure that the electrical equipment used on the installation site (main power switch, circuit breaker, wire, conduit and wiring terminals, etc.) have been selected according to current data, to ensure that the device in line with national standards.
- Check the power supply voltage in the range of 10% of the rated voltage and the ground wire is included in the power supply line. Otherwise, electrical parts will be damaged.
- Check whether the power supply is satisfied. Otherwise, the compressor will not start when the voltage is too low.
- By measuring the insulation resistance between the ground and the electrical device terminals, to ensure that more than 1 MΩ. Otherwise, the system can not be started until the cause of leakage and maintenance.

### Connection

- Connect the power cord to the terminal of the indoor unit and the outdoor mechanical and electrical gas box, connect the ground wire to the grounding bolt of the outdoor machine and the indoor mechanical and electrical air box.
- Connect the external and internal communication lines to the 1 and the 2 terminals on the terminal. If the power cord is connected, the printed circuit board will be damaged. And the use of shielded twisted pair wire.
- Do not connect the fastening screws on the front of the cover.
- The power cord must be made of copper wire, and the power supply must be in line with IEC 60245 requirements. If the power cord length exceeds 20m, the need to increase the size.
- The power supply line is fixed with a round connection terminal with an insulating protective sleeve. Not with sheet metal contact and extrusion, in order to avoid the cut line of skin caused by fire.

**Communication wiring figure**

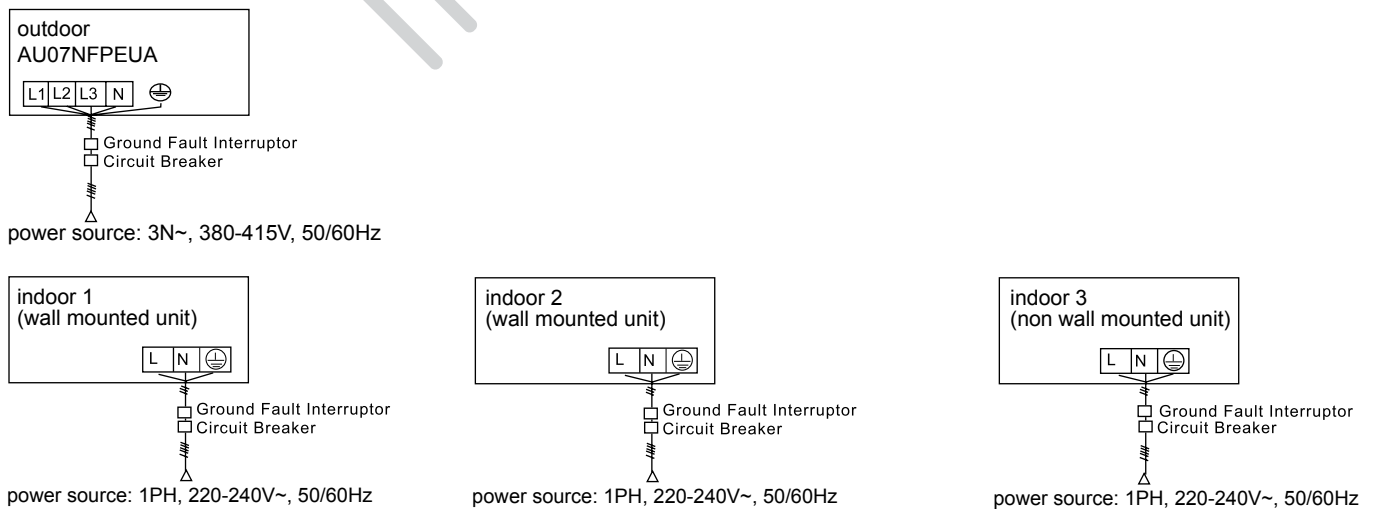

The master outdoor and all indoor units are in parallel through 2 non-polar wires.

There are three connecting ways between wired control and indoor units:

- A. One wired controller controls multiple units, as shown in the above figure, (1-3 indoor units). The indoor unit 3 is the wired control master unit (directly connected to the indoor unit of wired controller) and others are the wired control slave units. indoor unit 2 is DC fan motor models, indoor unit 1 is the AC fan motor models. The wired controller is connected with the master unit and DC fan motor models through three lines with polarity. Other indoor units and the master unit are connected via two lines with polarity. SW01 on the main unit is set to 0 while SW01 on other slave units are set to 1, 2, 3 and so on in turn. (Please refer to the dip switch setting)
- B. One wired controller controls one indoor unit, as shown in the above figure (indoor unit 4-5). The indoor unit and the wired controller are connected via three lines with polarity.
- C. Two wired controllers control one indoor unit, as shown in the figure (indoor unit 6). Either of the wired controllers can be set to be the master wired control while the other is set to be the slave wired controller. The master wired controller, slave wired controller and indoor units are connected via three lines with polarity.

| Type                    | Series                    | Model                   | PCB Code                    |
|-------------------------|---------------------------|-------------------------|-----------------------------|

### Power wiring figure

Indoor and outdoor use their individual power source. All indoors use one power source. Must install the leakage breaker and the over current breaker, or electric shock will occur.

## Outdoor power source and power cable

| Item<br>Model    |            | Power source                 | Power cable section (mm <sup>2</sup> ) | Circuit breaker (A) | Rated current of residual circuit breaker (A)<br>Ground fault interruptor (mA)<br>response time (S) | Ground wire                |       |
|------------------|------------|------------------------------|--|---------------------|---|----------------------------|-------|
|                  |            |                              |  |                     |   | Section (mm <sup>2</sup> ) | Screw |
| Individual Power | AU07NFPEUA | 3N~,<br>380-415V,<br>50/60Hz | 4                                      | 20                  | 20A 30mA below 0.1S   | 4                          | M5    |

- Power cable must be fixed firmly.
- To avoid electrical shock, make sure to disconnect the power supply 1 minute or more before servicing the electrical parts. Even after 1 minute, always measure the voltage at the terminals of main circuit capacitors or electrical parts and before touching, make sure that those voltages are 50VDC or less.
- To persons in charge of electrical wiring work: Do not operate the unit until the refrigerant piping is complete. (Running it before the piping is ready will break the compressor)
- Each outdoor must be earthed well.
- When power cable exceeds the range, thicken it appropriately.
- The appliance shall be installed in accordance with national wiring regulations.
- All wiring must be performed by an authorized electrician.
- Be sure to install an earth leakage circuit breaker in accordance with applicable legislation. Failure to do so may cause electrical shock.

## Indoor power source and communication wiring

### ⊘ PROHIBIT

- Power lines shall not use other wires other than copper wire.
- All internal and external machines must be connected to the ground of the power supply. The earthing wire shall not be connected to the ground wire of the gas pipe, water pipe, lightning rod or telephone. If the grounding is not appropriate, may cause electric shock or fire.
- Power supply must be installed leakage circuit breaker, otherwise, may cause electric shock or fire.
- The operation and maintenance of electrical equipment shall be carried out under the condition that the power supply is cut off.
- The indoor and outdoor units set their own independent power supply.
- The signal line and the power line must be independent, non electric signal line access.

| Item<br>Indoor total current (A) | Power cable section (mm <sup>2</sup> ) | Wire length (m) | Rated current of overcurrent breaker (A) | Rated current of residual circuit breaker(A)<br>Ground fault interruptor(mA)<br>response time(S) | Communication wire section                        |                                  |
|----------------------------------|--|-----------------|--|--|---|----------------------------------|
|                                  |  |                 |  |  | Outdoor/indoor (mm <sup>2</sup> )                 | Indoor/indoor (mm <sup>2</sup> ) |
| <10                              | 2                                      | 23              | 20                                       | 20A, 30mA, below 0.1s  | 2-core × (0.75-2.0mm <sup>2</sup> ) shielded wire |                                  |
| ≥10 and <15                      | 3.5                                    | 24              | 30                                       | 30A, 30mA, below 0.1s  |   |                                  |
| ≥15 and <22                      | 5.5                                    | 27              | 40                                       | 40A, 30mA, below 0.1s  |   |                                  |
| ≥22 and <27                      | 10                                     | 42              | 50                                       | 50A, 30mA, below 0.1s  |   |                                  |

- Power cable and communication wire must be fixed firmly.
- Each indoor must be grounded well.
- When power cable exceeds the range, increase the gauge appropriately.
- Shielded layer of communication wires must be connected together and be earthed at single point.
- The total length of communication wire cannot exceed 1000m.

### Communication wire for wired controller

| Wire length(m) | Wire spec                                   |
|----------------|---|
| ≤ 250          | 0.75mm <sup>2</sup> ×(3-core) shielded wire |

- Shielded layer of communication wire must be grounded at one end.
- The total length cannot exceed 250m.

### Outdoor unit electrical wiring diagram

|                       |                     |  |
|-----------------------|---------------------|--|
| <p><b>Correct</b></p> | <p><b>Error</b></p> | <p>When using a single terminal without terminal, the terminal can not be directly used without flux. Otherwise, it will cause abnormal heating of terminal crimping part. If a single core wiring is used in the wiring, it can be connected directly in the manner shown in the diagram.</p> |
|-----------------------|---------------------|--|

### 11. Outdoor Unit PCB

0151800146J

## 12. Dip Switch Setting

### (1) BM1 introduction

| BM1   | Definition                                   | Introduction |  |
|-------|--|--------------|--|
| BM1_1 | Indoor searching after startup               | OFF          | Begin to search indoor                                   |
|       |  | ON           | Stop searching indoor and lock the quantity              |
| BM1_2 | Celsius / Fahrenheit area selection          | OFF          | Celsius area   |
|       |  | ON           | Fahrenheit area  |
| BM1_3 | Static pressure selection                    | OFF          | 30Pa   |
|       |  | ON           | 0Pa (default)  |
| BM1_4 | Priority selection for energy saving /effect | OFF          | Energy saving priority                                   |
|       |  | ON           | Effect priority (default)                                |
| BM1_5 | Indoor ON / OFF simultaneous control         | OFF          | Every indoor unit can be controlled seperately (default) |
|       |  | ON           | All the indoor units will simultaneous ON or OFF         |
| BM1_6 | Defrosting condition selection               | OFF          | Not easy to frost area (default)                         |
|       |  | ON           | Easy to frost area                                       |
| BM1_7 | Defrosting level                             | OFF          | Ordinary (default)                                       |
|       |  | ON           | Strengthen (increase the defrosting time)                |
| BM1_8 | Quiet running function                       | OFF          | Quiet running function is unavailable (default)          |
|       |  | ON           | Quiet running function is available                      |

Note:

Either the indoor unit quantity unlocked or the locked quantity is different with actual connecting number, the unit cannot running.

| BM2                     | Definition                          | Introduction |                                      |  |            |
|-------------------------|-------------------------------------|--------------|--------------------------------------|--|------------|
| BM2-1                   | Cooling only or heat pump selection | OFF          | Heat pump (default)                  |  |            |
|                         |                                     | ON           | Cooling only                         |  |            |

| BM2-5                   | Power supply selection              | OFF          | Single phase                         |  |            |
|                         |                                     | ON           | 3-phase                              |  |            |
| BM2-6                   | Communication protocol selection    | OFF          | New communication protocol (default) |  |            |
|                         |                                     | ON           | Old communication protocol           |  |            |
| BM2-7<br>BM2-8          | Start mode selection                | BM2-7        | BM2-8                                | Start mode selection   |            |
|                         |                                     | OFF          | OFF                                  | First on indoor unit priority  |            |
|                         |                                     | OFF          | ON                                   | Last on indoor unit priority   |            |
|                         |                                     | ON           | OFF                                  | Cooling priority, any one indoor unit runs in cooling mode, the outdoor unit will run in cooling mode, the indoor units running in heating mode will stop  |            |
|                         |                                     | ON           | ON                                   | Heating priority, any one indoor unit runs in heating mode, the outdoor unit will run in heating mode, the indoor units running in cooling mode will stop. |            |

**Note: Either indoor unit unlocked or the locked quantity different with actual connecting number, it cannot run.**

If the BM2-2, BM2-3, BM2-4 and BM2-5 setting wrong, it will cause the "63" failure

*Note: communication protocol between indoor and outdoor units*

*The new communication protocol is faster than the old communication and its control content is more than the old one.*

*The indoor PCB 0151800113, 0151800161, 0151800161B, 0151800161C, 0151800227, 0151800227A, 0151800244, 0151800244B, 0151800244BA, 0151800086A, 0010451751AF, 0151800141A, 0010451751AE and 151800141 are new communication protocol.*

*The indoor PCB 0151800086 and 0010451181A are old communication protocol.*

*Old communication protocol indoor PCB can't connect with new communication protocol outdoor, so if this outdoor unit connect with old communication protocol indoor, need set the dip switch BM2-6 to ON position.*

## 2. bridge instruction

CJ1:

Short it before power ON-- PCB check its function (used for factory production. Short it after power ON-- time short function, 60 seconds become to 1 second.

CJ2: Reserved

## 13. Monitor Tools

### Main function instruction:

By setting the rotary switch, the digital tube will display the outdoor and indoor unit parameters (the outdoor current, discharge temp., suction temp., defrosting temp., coil temp. and outdoor ambient temp.; indoor unit coil temp. and valve open angle and so on), the data is inform of decimal integer. During the process of installation, adjustment and maintenance, the whole system's operating parameters can be tested conveniently which can help to check and solve problems quickly and correctly.

| SW01 | SW02 | Digital tube display  |
|------|------|---|
| 0    | 0    | Display outdoor failure code (when unlock the indoor quantity and the system is running normally, display indoor quantity, outdoor horse power and type of power supply circularly)<br>(1) The connection machine number: display "H" + machine units.<br>Such as "H08" means that the machine is connected to the 8 internal machine .<br>(2) Outdoor mechanism cold capacity: such as AU05 machine display 6HP.<br>(3) Power supply type: 220 represents a single phase 220V, and the 380 represents a three-phase 380V). |
|      | 1    | Display outdoor operation mode (stop: OFF, cooling: CCC, heating: HHH)  |
|      | 2    | Program version (one decimal)   |
|      | 3    | E2 version  |
|      | 4    | Target frequency of compressor, (press "start" for 5s to enter the manual frequency control, "Up / Down" can adjust the frequency, press "stop" for 5s to quit. Manual control, the frequency flashing display, otherwise display normally.)  |
|      | 5    | Actual frequency of compressor  |
|      | 6    | Indoor quantity   |
|      | 7    | Running indoor quantity   |
|      | 8    | Outdoor unit horse power  |
|      | 9    | Outdoor fan 1 speed (unit: rpm, max. display: 999)  |
|      | A    | Outdoor fan 2 speed (unit: rpm, max. display: 999)  |
|      | B    | Target average temp. of indoor Tc2 (unit: ℃)  |
|      | C    | Actual average temp. of indoor Tc2 (unit: ℃)  |
|      | D    | Target degree of superheat of PMV in heating (unit: ℃)  |
|      | E    | Outdoor special operation condition: The first position: power supply type (0-1Ph; 1- 3Ph)<br>The second position: quiet (0-OFF; 1-ON) ; The third position: gettinging operation (0-OFF; 1-ON)<br>(101: three phase power supply, mute off, open the gas)  |
|      | F    | Forced fan motor running, (press "start" for 5s to enter the manual fan motor control, "Up / Down" can adjust fan speed, press "stop" for 5s to quit) forced: flashing display "0-15", otherwise display "FAN". The outdoor failure can't affect this function.   |

| SW01 | SW02  | Digital tube display   |
|------|---|--|
| 1    | 0   | Td discharging temperature (unit: °C)  |
|      | 1   | Ta outdoor ambient temperature (unit: °C)  |
|      | 2   | Ts suction temperature (unit: °C)  |
|      | 3   | Te defrosting temperature (unit: °C)   |
|      | 5   | Pd high pressure (unit: kg, one decimal)   |
|      | 6   | Ps low pressure (unit: kg, one decimal)  |

|      | 9    | Reserve (display "---")  |

## 14. Outdoor Unit Control

### 1. Compressor startup control

After receiving the outdoor startup instruction, outdoor open SV1 30 seconds and then standby. When startup, the compressor will keep for 3 min at 45rps (when  $T_a < 40^\circ\text{C}$ ) or 3 min at 40rps (when  $T_a \geq 40^\circ\text{C}$ ). In cooling mode, meet running 1min &  $(T_d - CT) \geq 20^\circ\text{C}$  or  $P_s \leq 0.1\text{MPa}$  (or max. running time is 3min), quite the startup control;

In heating mode, meet running 1min and  $(T_d - CT) \geq 20^\circ\text{C}$  or  $P_s \leq 0.1\text{MPa}$  (or max. running time is 3min), quite the startup control;

During startup, the high pressure protection, high exhaust protection and current protection is priority and the low exhaust up frequency protection is shielded.

### 2. Compressor output control

Compressor Pd/Ps control, control the compressor frequency to output appropriate cooling/heating capacity. The control at the end of the startup control.

#### 2.1 In cooling mode:

According to the ambient temperature select target Ps automatically

| Mode                          | Effect priority mode (default)   | Energy-saving mode               | Outdoor ambient temperature                 | Ps correction during running                                      |
|-------------------------------|----------------------------------|----------------------------------|---|---|
| Target Ps                     | Setting value $-R^\circ\text{C}$ | Setting value $-R^\circ\text{C}$ | $T_a \leq 12^\circ\text{C}$                 | During running: correct the Ps according to the compression ratio |
| Target Ps (set by dip switch) | 0                                | 2                                | $12^\circ\text{C} < T_a < 40^\circ\text{C}$ |   |
| Target Ps                     | Setting value $+2^\circ\text{C}$ | Setting value $+2^\circ\text{C}$ | $T_a \geq 40^\circ\text{C}$                 |   |

R value setting:  $T_a < -5^\circ\text{C}$ , Target Ps: setting value  $-8^\circ\text{C}$

$-5^\circ\text{C} \leq T_a < 12^\circ\text{C}$ , Target Ps is the slope value of setting value and (setting value  $-8^\circ\text{C}$ )

#### 2.2 In heating mode:

According to the piping length to select target Pd and also according to the ambient temperature select target Pd automatically

| Mode                          | Effect priority mode (default)   | Energy-saving mode               | Outdoor ambient temperature | Pd correction during running                                      |
|-------------------------------|----------------------------------|----------------------------------|-----------------------------|---|
| Target Pd                     | Setting value $+3^\circ\text{C}$ | Setting value $+3^\circ\text{C}$ | $T_a \geq 15^\circ\text{C}$ | During running: correct the Pd according to the compression ratio |
| Target Pd                     | Setting value $+2^\circ\text{C}$ | Setting value $+2^\circ\text{C}$ | $T_a \geq 7^\circ\text{C}$  |   |
| Target Pd (set by dip switch) | 48                               | 46                               | $T_a \geq -5^\circ\text{C}$ |   |
| Target Pd                     | Setting value $-2^\circ\text{C}$ | Setting value $-2^\circ\text{C}$ | $T_a < -5^\circ\text{C}$    |   |

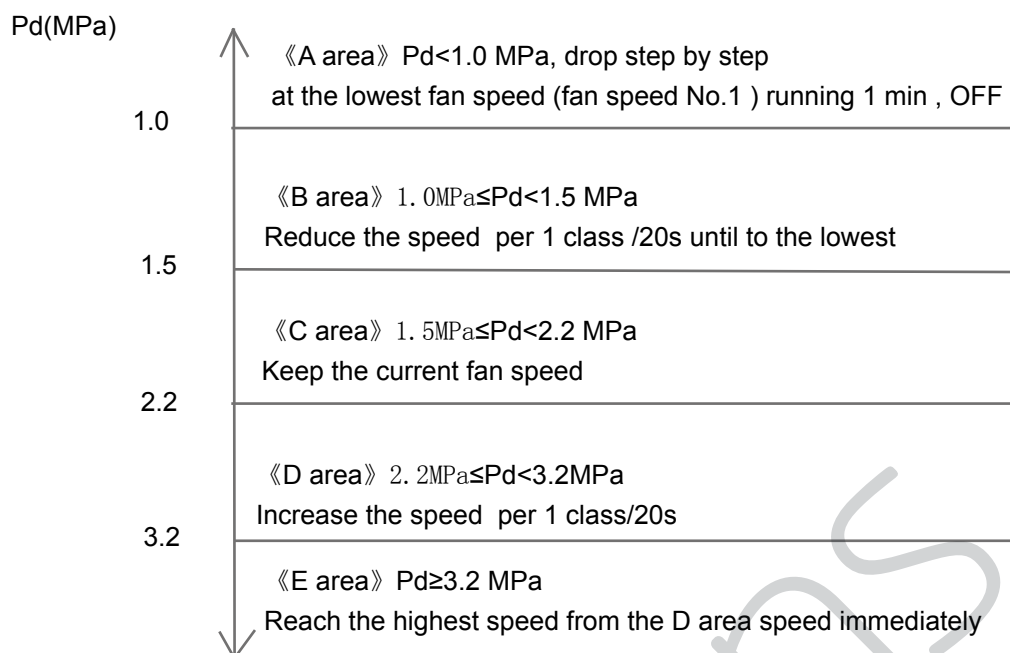

### 3. Outdoor fan motor control

#### 3.1 In cooling mode:

Outdoor fan motor running control during cooling mode is in high COP and 100% RPM running as much as possible.

Outdoor fan control in the operation of the refrigeration in the relation between high COP operation principle is to 100% as much as possible the RPM.

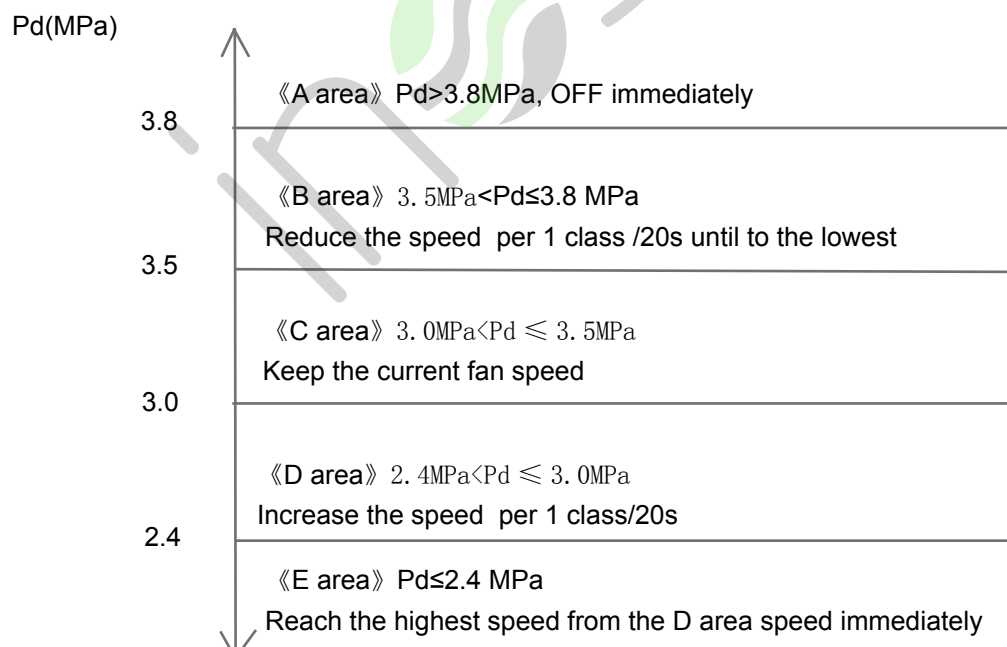

Pd is the main control standard.

When startup the fan motor speed refer to the following:

- $T_a \geq 35^\circ\text{C}$ : highest speed
- $25^\circ\text{C} \leq T_a < 35^\circ\text{C}$ : 6 speed
- $15^\circ\text{C} \leq T_a < 25^\circ\text{C}$ : 3 speed
- $T_a < 15^\circ\text{C}$ : OFF

### 3.2 In heating mode

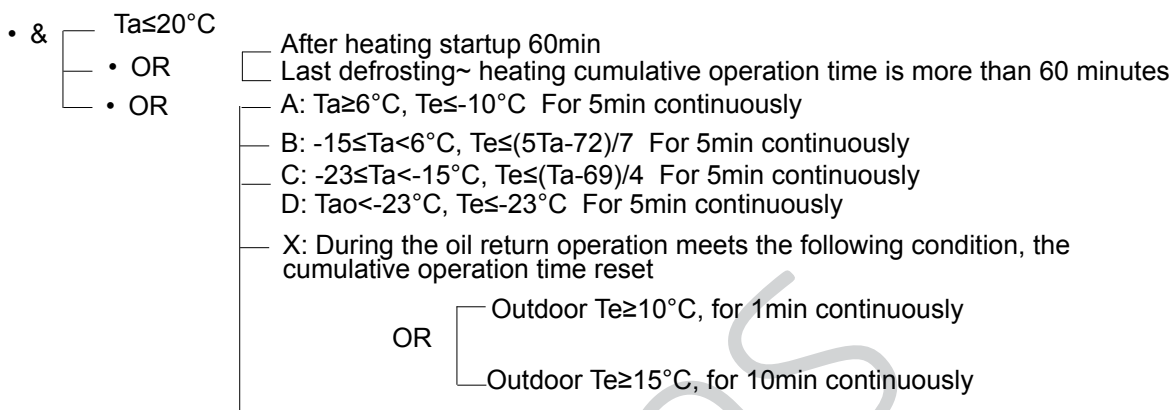

All the heating start, after the 4-way valve reversing (including defrosting, oil return and 4-way valve is electrified) the fan motor speed refer to the following:

- $T_a \leq 15^\circ\text{C}$ : highest speed
- $15^\circ\text{C} < T_a \leq 20^\circ\text{C}$ : 3 speed
- $T_a > 20^\circ\text{C}$ : 1 speed

## 4. Defrosting control

In order to have the effect heating operation, need defrosting control.

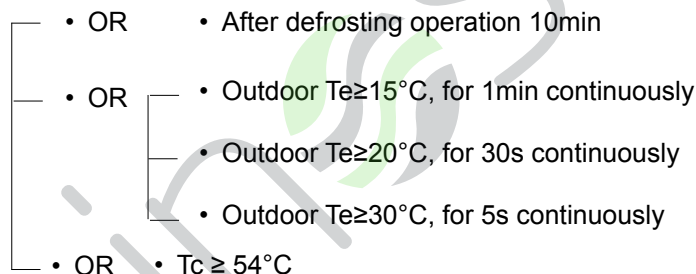

### 4.1 Entering condition:

### 4.2 Defrosting control

During defrosting, four-way valve power off, outdoor fan stop, indoor fan stop, outdoor PMV open to 470pls.

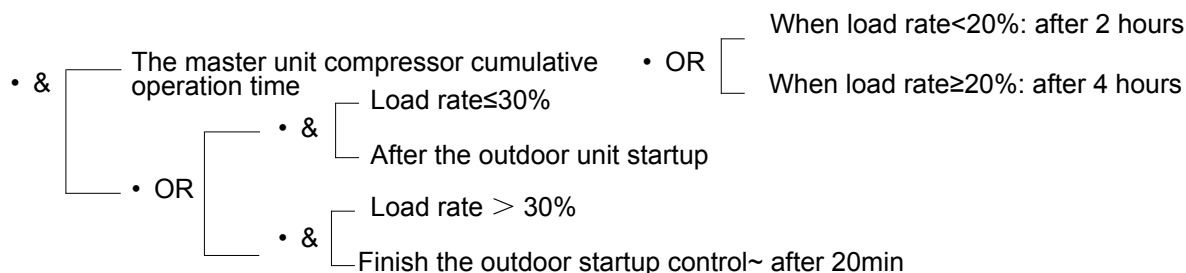

### 4.3 Quit defrosting

## 5. Oil return control

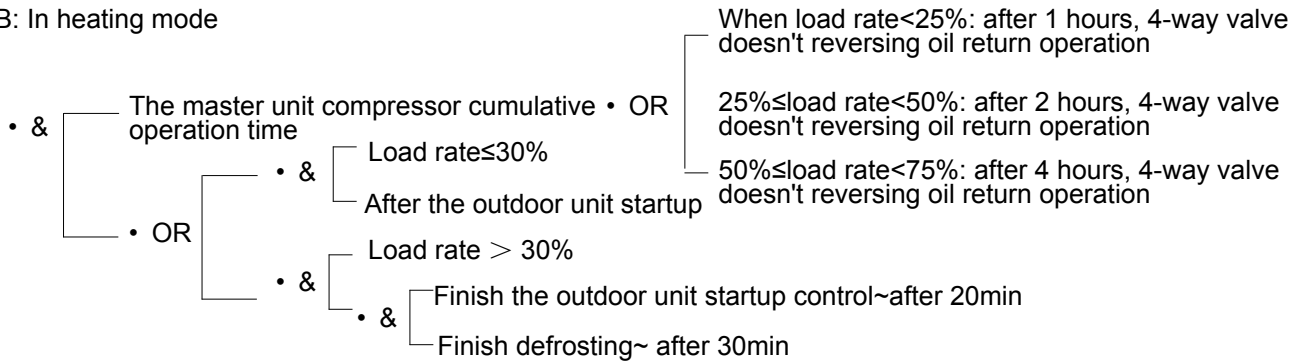

### 5.1 Entering condition:

A: In cooling mode

Note:  $load\ rate = \frac{\sum indoor\ HP(Thermo\ ON)}{\sum indoor\ HP} * 100\%$

B: In heating mode

Note: if load rate  $\geq 75\%$  and the outdoor unit output rate  $\geq 75\%$  for 10 min, oil return time reset

### 5.2 Oil return control

1) Oil return in cooling mode, the compressor according to the 75% of maximum frequency control, the outdoor PMV opening angle is 470 pls, the Thermo ON indoor PMV opening angle is 250 pls, the Thermo OFF indoor PMV opening angle is 125 pls.

2) Oil return in heating mode (4-way valve reversing), the compressor according to the 75% of maximum frequency control, the outdoor PMV opening angle is 470 pls, the Thermo ON and Thermo OFF indoor PMV opening angle is 125 pls. When  $T_d > 95^\circ\text{C}$  and  $T_d\text{SH} > 15^\circ\text{C}$ , the indoor PMV opening angle increased 10%, max. time is 2; When  $T_d < 90^\circ\text{C}$ , return to the usually opening.

3) Oil return in heating mode (4-way valve doesn't reversing), the compressor according to the indoor units load rate and current running frequency to confirm the oil return enter frequency, the maximum frequency can't exceed 75% of the maximum frequency. the PMV of the outdoor and the Thermo ON indoor unit control automatically, Thermo OFF indoor PMV opening angle is 250 pls.

### 5.3 Oil return quit condition:

1) In cooling mode

2) In heating mode (4-way valve reversing)

3) In heating mode (4-way valve doesn't reversing)

## 15. Failure code

| Digital tube indication on master unit | Indication on wired controller (hex) | Failure code definition                        | Failure description   | Remarks                         |
|--|--------------------------------------|--|---|---------------------------------|
| 20                                     | 14                                   | Defrosting temp. sensor Te failure             | Open circuit or short circuit for continuous 60seconds, alarm   | Resumable                       |
| 21                                     | 15                                   | Ambient temp. sensor Ta failure                |   | Resumable                       |
| 22                                     | 16                                   | Suction temp. sensor Ts failure                |   | Resumable                       |
| 23                                     | 17                                   | Discharging temp. sensor Td failure            |   | Resumable                       |
| 26                                     | 1A                                   | Indoor communication failure                   | For continuous 200 cycles, can not find connected indoors   | Resumable                       |
| 26-1                                   | 1A                                   |  | For continuous 300seconds, the searched indoor quantity is less than the set quantity.  |                                 |
| 26-2                                   | 1A                                   |  | For continuous 300seconds, the searched indoor quantity is more than the set quantity.  |                                 |
| 28                                     | 1C                                   | High pressure sensor Pd failure                | Open circuit or short circuit for continuous 60seconds, alarm   | Resumable                       |
| 29                                     | 1D                                   | Low pressure sensor Ps failure                 |   | Resumable                       |
| 30                                     | 1E                                   | High pressure switch HPS failure               | If disconnect for continuous 50ms, alarm. If alarm 3 times in an hour, confirm the failure  | Once confirmation, un-resumable |
| 33                                     | 21                                   | Outdoor EEPROM failure                         | Outdoor EEPROM failure  | Un-resumable                    |
| 34                                     | 22                                   | Discharging temp. too high protection (Td)     | $T_d \geq 239^\circ\text{F} (115^\circ\text{C})$ , alarm; $T_d \leq 185^\circ\text{F} (85^\circ\text{C})$ resume. If it occurs 3 times in an hour, confirm the failure.   | Once confirmation, un-resumable |
| 35                                     | 23                                   | 4-way valve reversing failure                  | After the compressor start for 10 minutes, 4-way valve can be met reversing pressure difference [6.0]kg, alarm, 3min resume, if it occurs 3 times in an hour, confirm the failure.  | Once confirmation, un-resumable |
| 39-0                                   | 27                                   | Low pressure Ps too low protection             | (1) In cooling, $P_s \leq [0.5]\text{kg}$ or $P_s \leq [1.0]\text{kg}$ for continuous 5min, alarm. $P_s \geq [2.5]\text{kg}$ , resume<br>(2) In heating, $P_s \leq [0.3]\text{kg}$ or $P_s \leq [0.5]\text{kg}$ for continuous 5min, alarm. $P_s \geq [2.0]\text{kg}$ , resume<br>if it occurs 3 times in an hour, confirm the failure. | Once confirmation, un-resumable |
| 39-1                                   | 27                                   | Compression ratio too high protection          | Compression ratio $\geq [8.0]$ for continuous 5min or compression ratio $\geq [9.0]$ for continuous 1min, stop and alarm. 3min later, resume automatically, if it occurs 3 times in an hour, confirm the failure.   |                                 |

| 118                                    | 76                                   | Compressor startup failure                                   | Compressor continuously startup 5 times all failed.  |  |
| 119                                    | 77                                   | Detecting circuit of transducer current is abnormal          | Current detection sensor of inverter controller is abnormal or unconnected or connected wrongly. |  |
| 120                                    | 78                                   | Power supply of inverter controller abnormal                 | Power supply of inverter controller is broken down instantly                                     |  |
| 121                                    | 79                                   | Power supply of inverter board is abnormal                   | Power supply of inverter controller is broken down instantly                                     | 3 times in an hour, confirm failure; once confirmation, un-resumable |
| 122                                    | 7A                                   | Radiator temp.sensor of module abnormal                      | Resistor of temp. sensor abnormal or temp. sensor disconnected                                   |  |
| 123                                    | 7B                                   | Transient over current of IPM module rectifier side hardware | Transient over current in IPM module rectifier side hardware                                     | 3 times in an hour, confirm failure; once confirmation, un-resumable |

When there is no failure, if the starting condition can not be met, digital tube on master unit will display stand-by code:

|       |   |   |           |
|-------|---|---|-----------|
| 555.0 | Standby state of capacity overmatch                       | When the ratio of indoor horse power and outdoor horse power is less than 50% or more than 130%, the system is in standby mode. | Resumable |
| 555.1 | Outdoor ambient temperature too high (heating)            | Ta>27°C, Standby  |           |
| 555.3 | Outdoor ambient temperature too high or too low (cooling) | Ta>54°C or Ta<-15°C, Standby  |           |
| 555.4 | Oil temp. preheat   | The oil temperature does not meet the system start-up conditions  |           |

Note:

1, The data in [ ] stores in EE

2, The PCB display failure method:

A. Digital display board: if the fault is 26-0, then display [26] first, and then display [-0]. If is 555.0, the first display [555], and then display [ . 0]. Failure code display is 1 second, failure display interval is 2 seconds.

B. LED light: the red light LED1 on behalf of ten digits, green light LED3 on behalf of the unit digit.

If it is 26-0, first LED1 flashes 2 times , then LED3 flashes 6 times. So circularly display.

If is 111-1, first LED1 flashes 11times, then LED3 flashes 1 time, and then LED1 normally on the LED3 flashes 1 time at the same time. So circularly display.

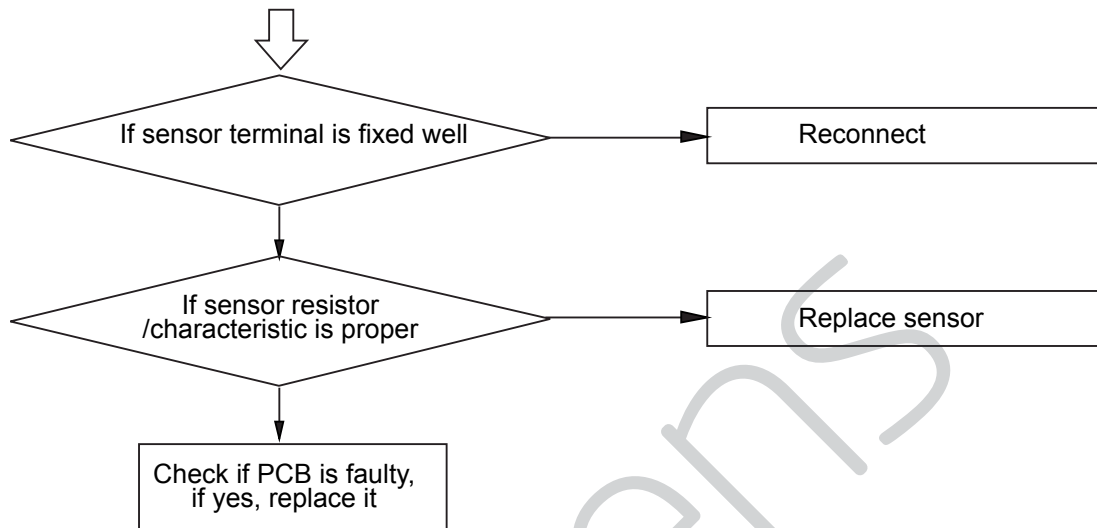

If is 555.0, the LED1 and LED3 normally on.

If is 555.4, the LED1 and LED3 flash 4 times at the same time. So circularly display.

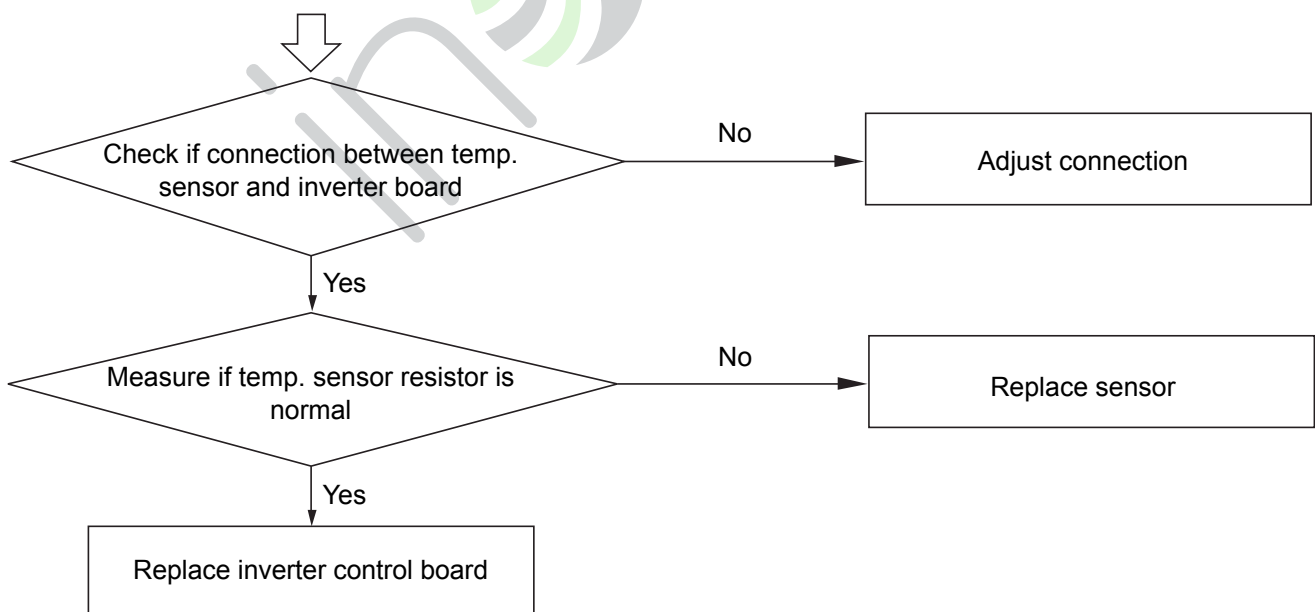

Flash frequency of LED lights is 2Hz, interval time is 2 seconds.
